

Disease and ill health: Prevalence of diabetes

HEADLINES

- Bolton's prevalence of diabetes is higher than both the national and regional averages;
- QOF prevalence only shows those diagnosed with diabetes by a GP. We know this is an underestimation and a more accurate picture is given by the Modelled Estimate and our local Bolton Health & Wellbeing Survey;
- Diabetes is increasing locally, regionally, and nationally;
- Diabetes is very strongly associated with ethnicity - the South Asian groups have by far the highest prevalence in Bolton;
- In some areas of Bolton with large South Asian communities prevalence is over 16%.

1. CURRENT PICTURE

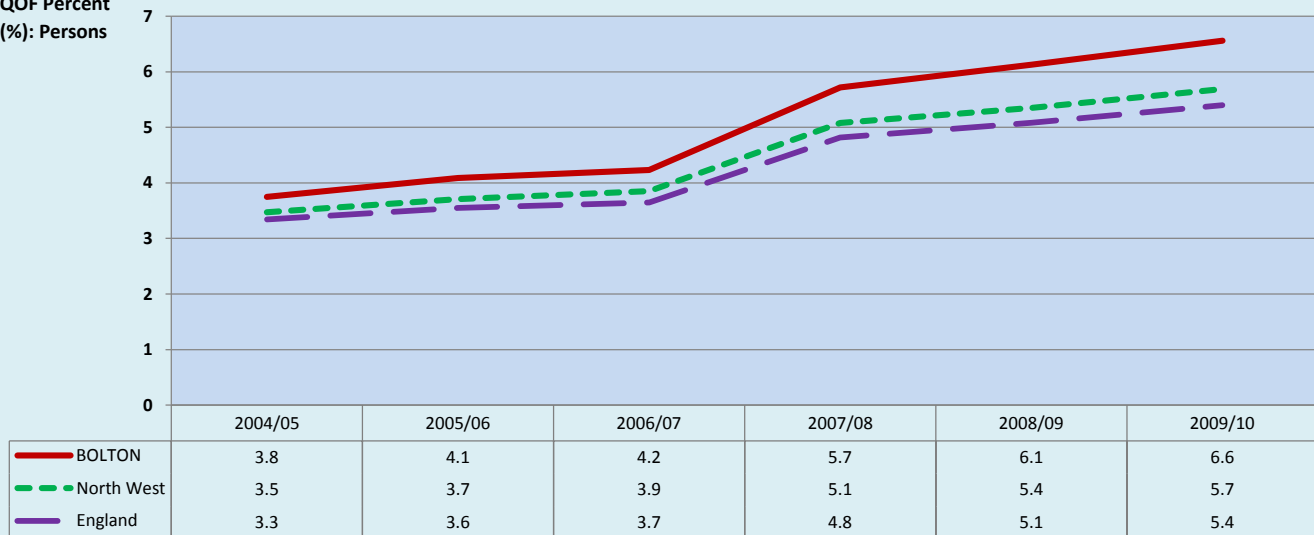

Various sources measure diabetes. QOF only measures diagnosed diabetes and so is an underestimation. Based on population characteristics, the modelled estimate gives a more accurate picture of the actual prevalence, whilst the survey figure provides a self-reported standardised percent and allows for comparison within Bolton.

	QOF (%)	Modelled (%)
BOLTON	6.6	8.3
North West	5.7	7.6
England	5.4	7.4
Bolton Health Survey (%)		
Bolton men	10.4	
Bolton women	7.6	

Diagnosed and potential no. of people: 13,300 — 16,800

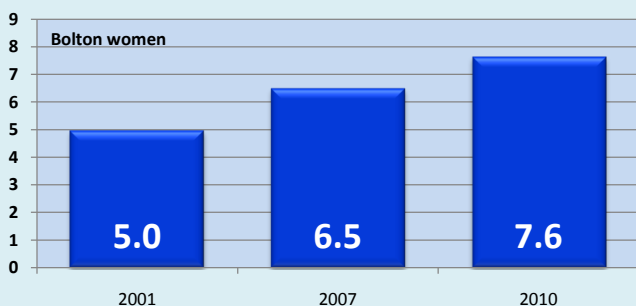

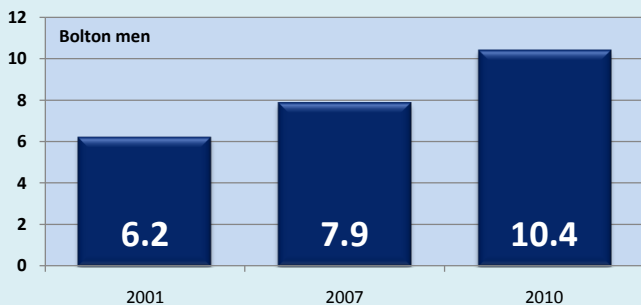

2. HISTORICAL TREND

QOF Percent (%) : Persons

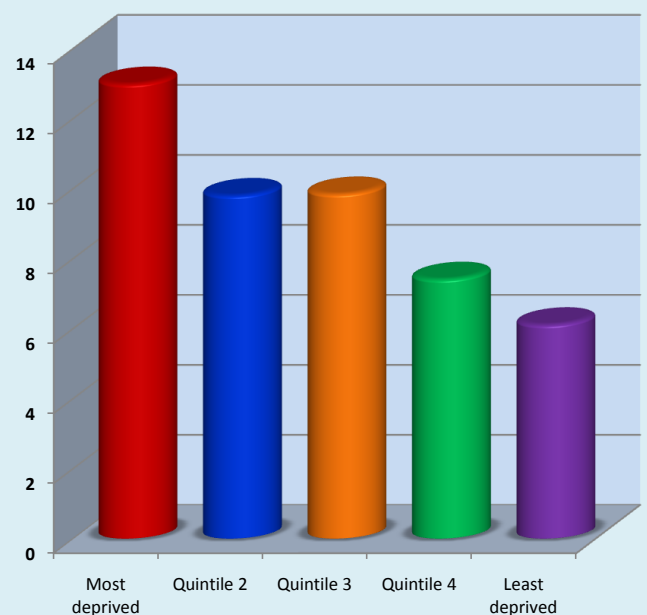

3. LOCAL HISTORICAL TREND BY GENDER

Standardised percent (%)

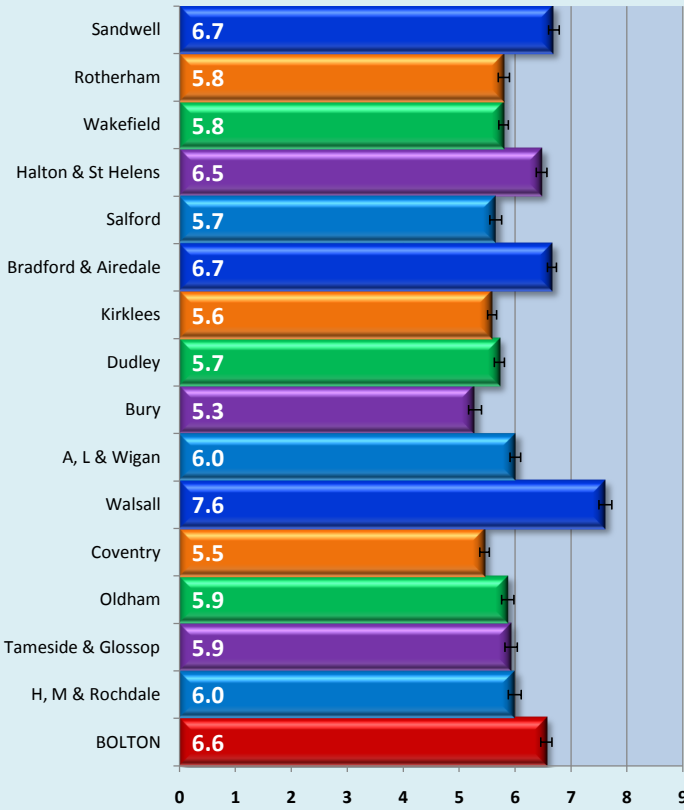

4. DEPRIVATION GROUPS

Standardised percent (%)

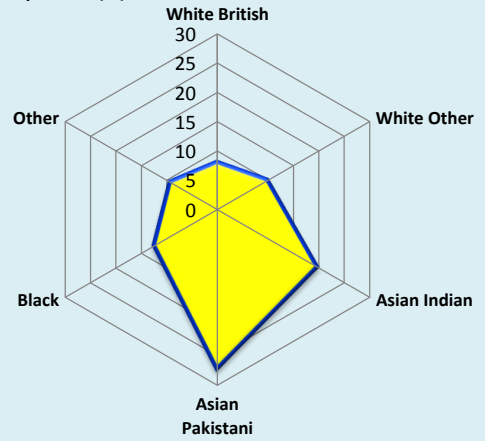

5. STATISTICAL PEERS CURRENT POSITION

QOF Percent (%): Persons

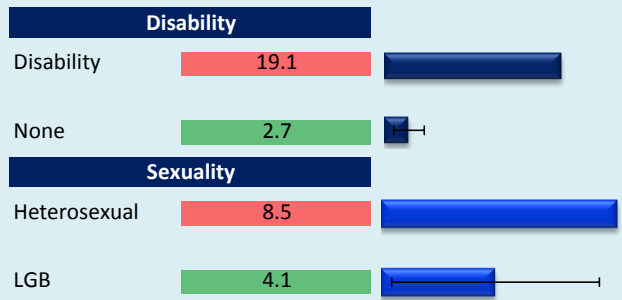

6. ETHNICITY

Standardised percent (%)

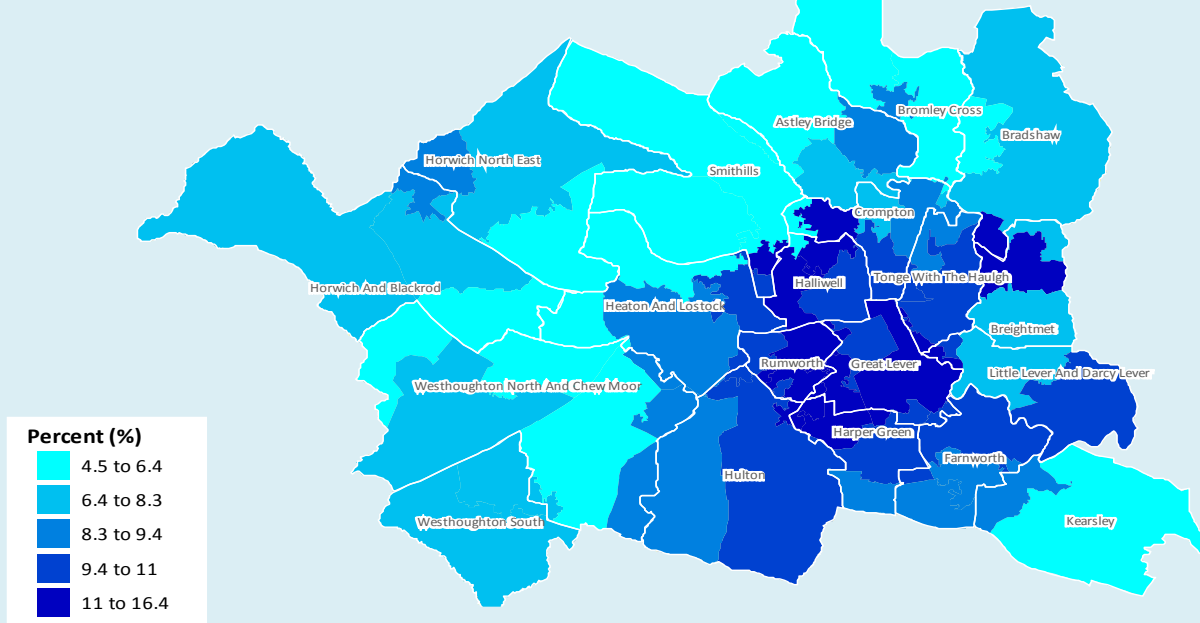

7. DISABILITY AND SEXUALITY

Standardised percent (%)

8. GEOGRAPHICAL INEQUALITIES

Standardised percent (%): Persons
